

# SPRINT TEAM ALLOCATION

## 7-Member Delivery Structure

|         |                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------|
| PURPOSE | Clear ownership across business modules, backend services, frontend components, and sprint deliverables. |
| MODEL   | One owner per complete business module, with explicit cross-layer responsibility.                        |
| FOCUS   | Functional ownership • Security • Reliability • Customer journey • Admin operations                      |

## Corporate Sprint Ownership Document

# 1. Team Ownership Overview

The sprint is divided into seven complete business modules. Each member owns a clearly defined functional area and is responsible for the associated backend, frontend, workflow, and delivery outcomes.

| Member     | Module                                   | Business Domain                            |
|------------|------------------------------------------|--------------------------------------------|
| Aleena     | Authentication & User Onboarding         | User Identity Management                   |
| Vanshika   | Security & Authorization                 | Application Security                       |
| Arjun      | Driver Management & Booking Engine       | Core Driver Operations                     |
| Prajan     | Payment & Trip Completion                | Trip Settlement & Billing                  |
| Saumya     | Feedback & AI Services                   | Customer Experience & AI                   |
| Aarti      | Admin Operations & Request Management    | Admin Command Center                       |
| Vaishalini | Customer Journey & Shared Infrastructure | Customer Operations & Platform Reliability |

# 1. Aleena — Authentication & User Onboarding

## BUSINESS DOMAIN

## User Identity Management

### SCOPE

- Login Component
- Signup/Registration Component
- AuthService
- AuthController
- User Entity
- LoginDTO
- UserRepo
- UserService + UserServiceImpl
- Form Validations
- Role-based Login Routing
- Logout Functionality
- Session Storage Handling

### BACKEND OWNERSHIP

- /api/register
- /api/login

### FRONTEND COMPONENTS

- login
- signup

### DELIVERABLES

- Registration flow
- Login flow
- Validation messages
- Duplicate email validation
- Role-based navigation

## 2. Vanshika — Security & Authorization

### BUSINESS DOMAIN

### Application Security

#### SCOPE

- JWT Generation
- JWT Validation
- Spring Security
- Auth Guard
- Route Protection
- SecurityConfig
- JwtAuthenticationFilter
- JwtUtil
- MyUserDetailsService
- CORS Config
- Role-based access control

#### BACKEND OWNERSHIP

- Security layer for all APIs

#### FRONTEND COMPONENTS

- AuthGuard
- Route protection

#### DELIVERABLES

- Secure APIs
- Token validation
- Unauthorized access handling
- Session expiration handling

# 3. Arjun — Driver Management & Booking Engine

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| BUSINESS DOMAIN                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Core Driver Operations |
| SCOPE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                        |

## 4. Prajan — Payment & Trip Completion

### BUSINESS DOMAIN

### Trip Settlement & Billing

#### SCOPE

- Trip Completion Workflow
- Trip End Logic
- Actual Duration Calculation
- Payment Calculation
- Payment Integration
- Payment Gateway Integration
- Payment Validation Layer
- Payment Summary Popup

#### BACKEND OWNERSHIP

- Payment calculation service
- Driver Request payment updates

#### FRONTEND COMPONENTS

- Fetch Pay Amount popup
- Payment Views

#### DELIVERABLES

- Dynamic fare calculation
- Duration calculation
- Payment processing
- Payment summary workflow

## 5. Saumya — Feedback & AI Services

### BUSINESS DOMAIN

Customer Experience & AI

### SCOPE

- Feedback Management
- Submit Feedback
- View Feedback
- Delete Feedback
- AI Features (Phase 2)
- Semantic Driver Search
- Gemini Integration
- Sentiment Analysis
- Auto-tagging
- Driver Review Summary

### BACKEND OWNERSHIP

- FeedbackController
- FeedbackService
- AiController
- AiService
- GeminiService

### FRONTEND COMPONENTS

- customer-post-feedback
- customer-view-feedback
- AI Search
- AI Summary

### DELIVERABLES

- Feedback System
- Review System
- AI Search
- AI Sentiment Badges
- AI Review Summary

## 6. Aarti — Admin Operations & Request Management

### BUSINESS DOMAIN

### Admin Command Center

#### SCOPE

- Request Administration
- View All Requests
- Approve Request
- Reject Request
- Close Request
- Workflow Management
- Stage Tracking Modal
- Request Progress Flow
- Admin Analytics
- Search Requests
- Filter Requests
- Driver Detail Popups

#### BACKEND OWNERSHIP

- Admin Request APIs
- Workflow updates

#### FRONTEND COMPONENTS

- admin-view-requests

#### DELIVERABLES

- End-to-End Admin Request Processing
- Status Workflows
- Request Stage Management

## 7. Vaishalini — Customer Journey & Shared Infrastructure

### BUSINESS DOMAIN

Customer Operations & Platform Reliability

### SCOPE

- Customer Request Management
- My Requests
- Edit Request
- Delete Request
- Show More Popup
- Global Error Handling
- Error Component
- ErrorLogs Storage
- Home Page
- Navbar Components
- Shared Models
- Shared Services Integration

### BACKEND OWNERSHIP

- Error Logging Table
- Exception Management

### FRONTEND COMPONENTS

- customer-view-requested
- homepage
- adminnav
- customernav
- error component

### DELIVERABLES

- Customer Request Lifecycle
- Error Management
- Navigation Infrastructure
- Shared UI Components

## 8. Why This Division Works

| PRINCIPLE                      | WHY IT MATTERS                                                                                                       |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Complete ownership</b>      | Everyone owns a complete business module rather than isolated technical tasks.                                       |
| <b>Clear accountability</b>    | Each module has an identifiable owner across scope, implementation, and delivery.                                    |
| <b>End-to-end coverage</b>     | Backend APIs, frontend components, workflows, and business outcomes are explicitly mapped.                           |
| <b>Reduced dependency</b>      | Modules are separated by business responsibility, allowing parallel sprint execution.                                |
| <b>Security by design</b>      | Authentication, authorization, JWT validation, route protection, and CORS are treated as a dedicated security layer. |
| <b>Operational reliability</b> | Concurrency, error handling, exception management, and session behavior are explicitly owned.                        |
| <b>Scalable foundation</b>     | Shared infrastructure and reusable navigation/components support future feature development.                         |

### SPRINT OWNERSHIP PRINCIPLE

One owner → one business module → clear backend + frontend scope → measurable deliverables.  
This structure keeps responsibilities visible, enables parallel execution, and makes sprint progress easier to track and review.
